Study compilation
Discover everStick® and the world of fibre reinforcement

everStick glass fibre reinforcements have been developed to provide strong solutions for minimally invasive dentistry. Researchers all around the world are investigating and documenting the clinical and laboratory evidence of their effectiveness.

The volume and extent of supportive independent research on everStick fibre reinforcements, as summarised here, clearly emphasises the global significance of these remarkable products.

IPN - The heart of everStick® fibres

Proper bonding between the fibres and composite is the key factor for a successful treatment.

Only everStick products have a unique, patented interpenetrating polymer network structure (IPN). The IPN technology is based on the ability of the polymer matrix to partially dissolve in the resin used for bonding.

Clinically this leads to superior bonding, enabling reliable surface retained applications and perfect handling properties. Because of this IPN structure, surfaces can be reactivated even after the final polymerisation. Reactivation is crucial for superior bonding when:

- Laboratory-manufactured restorations are cemented to teeth
- Fibre reinforced composite (FRC) restorations are remodelled or repaired

The IPN structure makes the everStick products fundamentally different from any other fibre or composite materials available on the market.
Minimally invasive and patient-friendly fibre reinforcement solutions for daily dentistry

The advantages of everStick

- Minimally invasive and reversible solutions, leaving all options open for future treatments
- Extensive clinical proof & in vitro research available
- Superior mechanical properties
- Unique patented bonding with IPN (interpenetrating polymer network) technology
- Economical alternative to indirect treatments

Indications

- Fibre-reinforced composite bridges
- Advanced root canal post & core structures
- Splints of mobile and traumatised teeth
- Orthodontic retainers

Mechanical properties and load bearing capacity

Based on the literature, glass fibre reinforcements (everStick) have been used to reinforce resin matrices and their strength and reinforcing effect are among the highest to be found. Several authors have reported that everStick fibre reinforcements have excellent mechanical properties with a relatively high modulus of elasticity and load bearing capacity, even after long-term water immersion.

Bonding performance of everStick fibres

everStick fibres are pre-impregnated with a unique light-polymerisable dimethacrylate resin system. It contains linear polymer phases that form a semi-IPN polymer network after being polymerised. That way, it offers a better bonding site for composite resin and tooth structure.

Extensive clinical studies and reports are available that demonstrate the benefits of using everStickC&B fibres. The findings of these studies indicate that restorations reinforced with everStickC&B are a valid alternative for replacing missing single anterior and posterior teeth. Such restorations appear to offer a reliable, minimally invasive, aesthetic and cost-efficient way to restore missing single teeth with predictable clinical performance and patient-oriented outcomes. Moreover, the versatility in fabrication techniques, whether direct or indirect, varying retention options through surface, inlay or hybrid retainers, and their capacity to be easily repaired in situ, are all considered major advantages and support the use of restorations reinforced with everStickC&B.

Fracture resistance of everStickC&B reinforced restorations

Several authors have reported scientific evidences supporting the use of everStickC&B reinforced restorations. They attributed the superior mechanical performance to the fibre structure and good connection with the resin matrix. The optimal adhesion between everStickC&B and resin is a key factor in load transfer and clinical success of all fibre-reinforced applications.

According to the available research, everStickPOST has proved to be successful clinically due to the mono-block effect formed by the luting agent, the post system and the core material and due to the bonding to dentin. everStickPOST provides a novel way of fabricating cost-effective, aesthetic and less time-consuming individually formed posts to restore endodontically treated teeth.
Marginal adaptation and bonding strength of everStickPOST to root canal dentin

Laboratory studies showed that individually formed fibre posts (everStickPOST) have higher dentin bond strength values and less microleakage in comparison to prefabricated fibre posts. Thanks to the IPN technology, everStickPOST bonds efficiently to adhesive cements and direct composite cores/restorations, enabling reliable surface-retained applications. Moreover, with everStickPOST the amount of luting cement can be minimised, thereby reducing the residual shrinkage of the cement and resulting in a better adaptation of the fibre post.

17. Bonding of fibre-reinforced composite post to root canal dentin.
    Le Bell AM et al.

    Le Bell AM et al.
Loading performance of endodontically treated teeth reinforced by everStickPOST

Many studies showed a significant increase in the fracture resistance of restored teeth when the individually formed fibre posts were adapted closely to the canal walls. When using everStickPOST, it is possible to fill large and irregular root canals more efficiently than with a single, prefabricated centrally positioned post.

Many clinical studies and reports demonstrate the merits of using everStickPERIO splints in stabilising periodontally affected teeth. Patient’s acceptance of the treatment is high and splints are considered durable, comfortable, aesthetic and easy to maintain. In addition, everStickPERIO splints do not hinder the individual and professional oral hygiene.

everStick®NET

Fracture behaviour of everStickNET reinforced restorations

Literature findings support the use of bidirectional fibre reinforcement (everStickNET) to increase the load bearing capacity of restorations. everStickNET has a beneficial effect on the failure mode and thereby on the re-restorability in case of fracture. A number of authors stated that everStickNET is also a suitable material to repair veneers.

Marginal adaptation of everStickNET reinforced restorations

Combination of everStickNET with flowable composite helps to reduce microleakage in adhesive composite restorations and shows a better marginal adaptability for veneer restorations.

In vitro comparison between everStickORTHO and stainless steel orthodontic retainers

Laboratory findings suggest that fibre-reinforced composite retainers with everStickORTHO may be an effective option for orthodontic retention. Hence, everStickORTHO can be considered a viable aesthetic alternative for full-size stainless steel wires. Furthermore, several authors declared that fibre-reinforced composite space maintainers may be a clinically acceptable and expedient alternative to the conventional band-loop appliances.

6. Shear bond strength of different retainer wires and bonding adhesives in consideration of the pretreatment process.

11. Development and testing of fiber-reinforced composite space maintainers.

13. Force levels of fiber-reinforced composites and orthodontic stainless steel wires: a 3-point bending test.

**everStick®C&B Anterior Bridge**

1. **Initial situation**
   - Measure the length of fibre needed
2. **Prepare the space for the post**
3. **Measure the length needed**
4. **Choose the size, and cut out the post from the silicone**
5. **Shorten the post to the desired length**
6. **Fit the post inside the root canal**
7. **Taper the post if necessary**

**Intermediate result after light-curing**

- **Place the post inside the root canal**
- **Fill the canal with shorter posts if needed, and condense them laterally**
- **Use a dual-cure composite luting for the cementation**
- **Insert the condensed post into the canal**
- **Light-cure for at least 40 seconds**
- **Continue the build-up with composite & light-cure**
- **Final situation**

**everStick®POST**

1. **Initial situation**
2. **Prepare the space for the post**
3. **Measure the length needed**
4. **Choose the size, and cut out the post from the silicone**
5. **Shorten the post to the desired length**
6. **Fit the post inside the root canal**
7. **Taper the post if necessary**

**Place the post inside the root canal**

- **Fill the canal with shorter posts if needed, and condense them laterally**
- **Use a dual-cure composite luting for the cementation**
- **Insert the condensed post into the canal**
- **Light-cure for at least 40 seconds**
- **Continue the build-up with composite & light-cure**
- **Final situation**

**everStick®PERIO**

1. **Initial situation**
2. **Measure the length of fibre needed**
3. **Cut the fibre bundle inside the silicone**
4. **Clean the teeth with pumice and water**
5. **Etch the teeth for 45-60 seconds**
6. **Bond the etched area and light-cure**
7. **Apply a flowable composite; do not light-cure**
8. **Position the fibre on top of the flowable**

**Position the fibre on top of the flowable**

- **Spread the fibre on the surface of the first tooth**
- **Light-cure while protecting the rest of the fibre**
- **Proceed in the same way for each tooth**
- **Intermediate result after light-curing**
- **Cover the fibre completely with a flowable & light-cure**
- **Final situation**
everStick®NET

Measure the length needed
Cut the fibre net at the desired length
Cut out two or three fibre strips of different widths
Clean the teeth with pumice and water
Etch the teeth for 45-60 seconds
Bond the etched area and light-cure
Apply a flowable composite, do not light-cure!

Remove the fibre net from its protective paper
Position one fibre strip at a time
Light-cure 5-10 seconds per tooth while protecting the rest of the fibre from the light
Apply a thin layer of light-curing resin on the cured strip. Position the second strip on top, and light-cure tooth per tooth.
Repeat the same procedure for the third fibre strip.
Cover the cured fibre net with flowable composite and light-cure for 40 seconds per tooth
Final situation after finishing the fibre splint

everStick®ORTHO

Initial situation
Measure the length of fibre needed
Cut the fibre bundle inside the silicone
Clean the teeth with pumice and water
Etch the teeth for 45-60 seconds
Bond the etched area and light-cure
Apply a flowable composite, do not light-cure!

Position the fibre on top of the flowable
Spread the fibre on the surface of the first tooth
Light-cure while protecting the rest of the fibre
Proceed in the same way for each tooth
Intermediate result after light-curing
Cover the fibre completely with a flowable & light-cure
Final situation
